WHAT IS XIAFLEX®?
XIAFLEX® is a prescription medicine used to treat adults with Dupuytren’s contracture when a “cord” can be felt. It is not known if XIAFLEX® is safe and effective in children under the age of 18.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX®
Do not receive XIAFLEX® if you have had an allergic reaction to collagenase clostridium histolyticum or any of the ingredients in XIAFLEX®, or to any other collagenase product. See the end of the Medication Guide for a complete list of ingredients in XIAFLEX®.

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.

WHAT IS DUPUYTREN’S CONTRACTURE?

A hand condition that may get worse over time

Dupuytren’s contracture is a progressive hand condition that can limit how much you can move or straighten your fingers. It’s caused by a buildup of collagen under the skin that can form a rope-like cord. As time goes on, it can bend one or more of your fingers so you can’t straighten them.

MP = metacarpophalangeal; PIP = proximal interphalangeal

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

XIAFLEX® can cause serious side effects, including:

• Tendon rupture or ligament damage. Receiving an injection of XIAFLEX® may cause damage to a tendon or ligament in your hand and cause it to break or weaken. This could require surgery to fix the damaged tendon or ligament. Call your healthcare provider right away if you have trouble bending your injected finger (towards the wrist) after the swelling goes down or you have problems using your treated hand after your follow-up visit.

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.
WHO IS AT RISK FOR DUPUYTREN’S CONTRACTURE?

Although the exact cause is unknown, some people are more likely to have Dupuytren’s contracture

Risk factors include:

- **Age**
  - More common in people over 40

- **Family history**
  - Often runs in families

- **Smoking**
  - May increase risk

- **Gender**
  - More likely to occur in men

- **Family background**
  - More common in people with Northern European ancestry (Viking disease)

- **Diabetes**
  - Also believed to increase risk

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

XIAFLEX® can cause serious side effects, including:

- Nerve injury or other serious injury of the hand. Call your healthcare provider right away if you get numbness, tingling, increased pain, or tears in the skin (laceration) in your treated finger or hand after your injection or after your follow-up visit

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.
HOW DOES DUPUYTREN’S CONTRACTURE AFFECT YOU?

As time passes, Dupuytren’s contracture can bend one or more of your fingers so you can’t straighten them.

It’s important to recognize the signs and talk to a hand specialist early on if you think you may have Dupuytren’s contracture. This condition may get worse over time. A doctor can help you treat it, though.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

XIAFLEX® can cause serious side effects, including:

- Hypersensitivity reactions, including anaphylaxis. Severe allergic reactions can happen in people who receive XIAFLEX® because it contains foreign proteins. Call your healthcare provider right away if you have any of these symptoms of an allergic reaction after an injection of XIAFLEX®:
  - hives
  - breathing trouble
  - low blood pressure
  - swollen face
  - chest pain
  - dizziness or fainting

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.
HOW XIAFLEX® WORKS TO TREAT DUPUYTREN’S CONTRACTURE

XIAFLEX® is given by a trained hand specialist in a doctor’s office

Scan the code to learn more about XIAFLEX®

How is XIAFLEX® given?
XIAFLEX® is given:
• In a doctor’s office
• By a hand specialist with XIAFLEX® training
• With no general anesthesia required

How can XIAFLEX® help?
Studies show that prescription XIAFLEX®, along with a finger extension procedure, may help straighten or nearly straighten the affected finger and improve range of motion after up to 3 injections.

83% (206 out of 249) of patients were satisfied with XIAFLEX® compared with 30% (38 out of 125) of patients with placebo.*

*In 2 clinical studies, patients were asked to rate their satisfaction with treatment on Day 90 as “very satisfied,” “quite satisfied,” “neither satisfied nor dissatisfied,” “quite dissatisfied,” or “very dissatisfied.” For data analysis, “satisfied” includes patients who chose “very satisfied” or “quite satisfied.”

In these 2 clinical studies, patients received up to 3 injections of XIAFLEX® or placebo into a cord that could be felt on Days 0, 30, and 60. About 24 hours after each injection, patients had a finger extension procedure and were fitted with a splint to wear at bedtime for up to 4 months. Patients also performed finger exercises every day.

In these 2 studies, 60% of patients had a straight or nearly straight finger 30 days after the last injection on Days 30, 60, or 90 after up to 3 XIAFLEX® injections and finger extension procedures compared with 6% of patients who received placebo.

The most common side effects with XIAFLEX® in these studies were swelling of the injected hand and bruising or bleeding at the injection site.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)
XIAFLEX® can cause serious side effects, including:
• Increased chance of bleeding. Bleeding or bruising at the injection site can happen in people who receive XIAFLEX®. Talk to your healthcare provider if you have a problem with your blood clotting. XIAFLEX® may not be right for you.

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.
Real-world XIAFLEX® results

The following are examples of actual patients treated with XIAFLEX®

Patients had finger extensions performed by a physician. They were then fitted with a splint and told to use a splint at bedtime for up to 4 months. They were also told to perform daily finger exercises.

In studies, patients received up to 3 injections of XIAFLEX® or placebo into a cord that could be felt at approximately 4-week intervals.

The most common side effects with XIAFLEX® for the treatment of Dupuytren’s contracture include swelling of the injection site or the hand; bruising or bleeding at the injection site; pain or tenderness of the injection site or the hand; swelling of the lymph nodes (glands) in the elbow or armpit; itching; breaks in the skin; redness or warmth of the skin; pain in the armpit.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

Before receiving XIAFLEX®, tell your healthcare provider if you have had an allergic reaction to a previous XIAFLEX® injection, or have a bleeding problem or any other medical conditions. Tell your healthcare provider about all the medicines you take including prescription and non-prescription medicines, vitamins, and herbal supplements. Using XIAFLEX® with certain other medicines can cause serious side effects. Especially tell your healthcare provider if you take medicines to thin your blood (anticoagulants). If you are told to stop taking a blood thinner before your XIAFLEX® injection, your healthcare provider should tell you when to restart the blood thinner. Ask your healthcare provider or pharmacist for a list of these medicines if you are unsure.

Tell your healthcare provider if you have any side effect that bothers you or does not go away. These are not all of the possible side effects with XIAFLEX®. For more information, ask your healthcare provider or pharmacist.

Treatment of one contracture

This patient had a cord that could be felt causing a contracture of the MP joint of the left ring finger. The cord was injected with XIAFLEX®, and a finger extension procedure was performed 48 hours later.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.

Real-world XIAFLEX® results

Treatment of one contracture

This patient had a cord that could be felt causing a contracture of the PIP joint of the left pinky finger. The cord was injected with XIAFLEX®, and a finger extension procedure was performed 48 hours later.

Treatment of two contractures on the same hand

This patient had a cord that could be felt causing contractures of the MP and PIP joints of the left pinky finger. The cord was injected with XIAFLEX® at each location, and a finger extension procedure was performed 48 hours later.

Actual patient. Images used with permission from physician and patient.

MP = metacarpophalangeal; PIP = proximal interphalangeal

Individual results may vary.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

The most common side effects with XIAFLEX® for the treatment of Dupuytren’s contracture include:

- swelling of the injection site or the hand
- bruising or bleeding at the injection site
- pain or tenderness of the injection site or the hand
- swelling of the lymph nodes (glands) in the elbow or armpit
- itching
- breaks in the skin
- redness or warmth of the skin
- pain in the armpit

In studies, patients received up to 3 injections of XIAFLEX® or placebo along with finger extension procedures at approximately 4-week intervals.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

Tell your healthcare provider if you have any side effect that bothers you or does not go away. These are not all of the possible side effects with XIAFLEX®. For more information, ask your healthcare provider or pharmacist.

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.
TREATMENT WITH XIAFLEX®

Know what to expect from your XIAFLEX® procedure

You now know that XIAFLEX® is given in a doctor’s office by a hand specialist trained to use XIAFLEX®. But what is the procedure like?

IMPORTANT SAFETY INFORMATION FOR XIAFLEX®

Do not receive XIAFLEX® if you have had an allergic reaction to collagenase clostridium histolyticum or any of the ingredients in XIAFLEX®, or to any other collagenase product. See the end of the Medication Guide for a complete list of ingredients in XIAFLEX®.

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.
About 30 days after the injection, you should return to the doctor to have your finger(s) examined. Depending on your results, or if the cord(s) is still present, you may need additional injections or finger extension procedures (up to 3 times per cord), approximately 4 weeks apart.

**STEP 1— Receiving the injection**

The doctor will:
- Inject XIAFLEX® directly into the cord that is causing your finger(s) to bend
  - If you have more than 1 contracture, the doctor may give you 2 injections in 1 of your hands during the same visit
  - General anesthesia isn’t required
  - The doctor may use a local anesthetic to make you feel more comfortable
- Wrap your treated hand with bandages
- Advise you to limit the movement of your treated fingers
- Instruct you to keep your hand elevated until bedtime

Do not bend or straighten the treated finger(s) yourself.

**STEP 2— Extending your finger(s)**

Your first follow-up visit with the doctor will be about 1 to 3 days after the injection. If you still have the cord, the doctor may try to extend the treated finger(s) and “break” the cord. This is to help straighten your finger(s). The doctor may use a local anesthetic during this procedure.

After the extension procedure, the doctor will:
- Ask you to do simple finger exercises daily
- Instruct you to wear a splint at bedtime
- Advise you on how long to wait before resuming normal activities with the treated hand

**STEP 3— Checking your progress**

About 30 days after the injection, you should return to the doctor to have your finger(s) examined. Depending on your results, or if the cord(s) is still present, you may need additional injections or finger extension procedures (up to 3 times per cord), approximately 4 weeks apart.

**IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)**

XIAFLEX® can cause serious side effects, including:
- Tendon rupture or ligament damage. Receiving an injection of XIAFLEX® may cause damage to a tendon or ligament in your hand and cause it to break or weaken. This could require surgery to fix the damaged tendon or ligament. Call your healthcare provider right away if you have trouble bending your injected finger (towards the wrist) after the swelling goes down or you have problems using your treated hand after your follow-up visit.

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.

CONSIDERATIONS FOR DURING AND AFTER XIAFLEX® TREATMENT

When to contact the doctor and tips for performing hand exercises

XIAFLEX® is proven as safe and effective for the treatment of Dupuytren’s contracture. Like any procedure, though, there are things you and the doctor should look out for.

At any point during XIAFLEX® treatment and follow-ups, call the doctor right away if you experience:

- Signs of infection after your injection, such as fever, chills, increased redness, or swelling
- Numbness or tingling in the treated finger(s)
- Trouble bending the injected finger(s) after the swelling goes down
- Tears in the skin of your treated finger(s)

Note that Dupuytren’s contracture may return, no matter what treatment is used, whether it’s surgical or nonsurgical (like XIAFLEX®). You can receive multiple injections of XIAFLEX® if necessary.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

XIAFLEX® can cause serious side effects, including:

- Nerve injury or other serious injury of the hand. Call your healthcare provider right away if you get numbness, tingling, increased pain, or tears in the skin (laceration) in your treated finger or hand after your injection or after your follow-up visit

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.

Look at the next page to see some after-treatment exercises
The following are examples of finger exercises you can do at home after your finger extension procedure.

This information should not take the place of talking with your doctor or healthcare professional. If you have any questions, talk to your doctor.

**Exercise 1**

Lay your hand flat on the table. Move each finger from side to side (like a windshield wiper) one at a time; repeat 10 times. Repeat this exercise 4 times a day.

**Exercise 2**

Lay your hand flat on the table. Move each finger from side to side (like a windshield wiper) one at a time; repeat 10 times. Repeat this exercise 4 times a day.

**Exercise 3**

Bend only the top 2 joints of all fingers, keeping your knuckles straight. Arch your knuckles back 10 times in a row. Repeat this exercise 4 times a day.

**Exercise 4**

Use the unaffected hand to gently straighten the affected finger 10 times, holding for 5 to 10 seconds. Repeat this exercise 4 times a day.

CONSIDERATIONS FOR DURING AND AFTER XIAFLEX® TREATMENT

When to contact the doctor and tips for performing hand exercises

XIAFLEX® is proven as safe and effective for the treatment of Dupuytren’s contracture. Like any procedure, though, there are things you and the doctor should look out for.

**IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)**

XIAFLEX® can cause serious side effects, including:

- Nerve injury or other serious injury of the hand. Call your healthcare provider right away if you get numbness, tingling, increased pain, or tears in the skin (laceration) in your treated finger or hand after your injection or after your follow-up visit.

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.
COST SUPPORT FOR XIAFLEX®

Eligible patients can save on their XIAFLEX® copay

$0 copay for most eligible patients with commercial insurance plans through the XIAFLEX® Copay Assistance Program.*

Restrictions apply. See full terms and conditions at xiaflex-savings.com

*Based on analysis of claims filed September 2011 through March 2018.

In situations in which you need to pay for XIAFLEX®, how much you pay will depend on your health benefits or insurance coverage. The XIAFLEX® Copay Assistance Program can cover up to $1200 of your out-of-pocket costs for each vial.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX® (CONT.)

XIAFLEX® can cause serious side effects, including:

- Hypersensitivity reactions, including anaphylaxis. Severe allergic reactions can happen in people who receive XIAFLEX® because it contains foreign proteins. Call your healthcare provider right away if you have any of these symptoms of an allergic reaction after an injection of XIAFLEX®:
  - hives
  - breathing trouble
  - low blood pressure
  - swollen face
  - chest pain
  - dizziness or fainting

Please see additional Important Safety Information for XIAFLEX® on pages 26-27.
WHAT IS XIAFLEX®?

XIAFLEX® is a prescription medicine used to treat adults with Dupuytren’s contracture when a “cord” can be felt. It is not known if XIAFLEX® is safe and effective in children under the age of 18.

IMPORTANT SAFETY INFORMATION FOR XIAFLEX®

Do not receive XIAFLEX® if you have had an allergic reaction to collagenase clostridium histolyticum or any of the ingredients in XIAFLEX®, or to any other collagenase product. See the end of the Medication Guide for a complete list of ingredients in XIAFLEX®.

XIAFLEX® can cause serious side effects, including:

• Tendon rupture or ligament damage. Receiving an injection of XIAFLEX® may cause damage to a tendon or ligament in your hand and cause it to break or weaken. This could require surgery to fix the damaged tendon or ligament. Call your healthcare provider right away if you have trouble bending your injected finger (towards the wrist) after the swelling goes down or you have problems using your treated hand after your follow-up visit.

• Nerve injury or other serious injury of the hand. Call your healthcare provider right away if you get numbness, tingling, increased pain, or tears in the skin (laceration) in your treated finger or hand after your injection or after your follow-up visit.

• Hypersensitivity reactions, including anaphylaxis. Severe allergic reactions can happen in people who receive XIAFLEX® because it contains foreign proteins. Call your healthcare provider right away if you have any of these symptoms of an allergic reaction after an injection of XIAFLEX®:
  — hives
  — swollen face
  — breathing trouble
  — chest pain
  — low blood pressure
  — dizziness or fainting

• Increased chance of bleeding. Bleeding or bruising at the injection site can happen in people who receive XIAFLEX®. Talk to your healthcare provider if you have a problem with your blood clotting. XIAFLEX® may not be right for you.

Before receiving XIAFLEX®, tell your healthcare provider if you have had an allergic reaction to a previous XIAFLEX® injection, or have a bleeding problem or any other medical conditions. Tell your healthcare provider about all the medicines you take, including prescription and non-prescription medicines, vitamins, and herbal supplements. Using XIAFLEX® with certain other medicines can cause serious side effects. Especially tell your healthcare provider if you take medicines to thin your blood (anticoagulants). If you are told to stop taking a blood thinner before your XIAFLEX® injection, your healthcare provider should tell you when to restart the blood thinner. Ask your healthcare provider or pharmacist for a list of these medicines if you are unsure.

The most common side effects with XIAFLEX® for the treatment of Dupuytren’s contracture include:

• swelling of the injection site or the hand
• bruising or bleeding at the injection site
• pain or tenderness of the injection site or the hand
• swelling of the lymph nodes (glands) in the elbow or armpit
• itching
• breaks in the skin
• redness or warmth of the skin
• pain in the armpit

Tell your healthcare provider if you have any side effect that bothers you or does not go away. These are not all of the possible side effects with XIAFLEX®. For more information, ask your healthcare provider or pharmacist.
